Recent additions to package HDF5Array

Recent additions to package HDF5Array

## ConstantArray objects (by Aaron)

#### This would ordinarily take up 8 TB of memory:

```
library(DelayedArray)
CM <- ConstantArray(c(1e6, 1e6), value=NA_real_)
CM
   <1000000 x 1000000> matrix of class ConstantMatrix and type "double":
                     [.1]
                                 [.2]
                                             [,3] ... [,999999] [,1000000]
         [1.]
##
                       NA
                                   NA
                                                               NA
                                                                           NA
         [2.]
##
                       NA
                                   NA
                                               NA
                                                               NA
                                                                           NA
         [3.]
                                   NA
                                               NA
                                                               NA
                                                                           NA
         [4.]
                       NA
                                   NA

                                                               NA
                                                                           NA
    [999998.]
                       NA
                                   NΑ
                                               NA
                                                               NA
                                                                           NA
    [999999,]
                                               NΑ
                                                               NΑ
                                                                           NA
## [1000000,]
                       NA
                                   NΑ
                                               NA
                                                               NA
                                                                           NA
```

lobstr::obj\_size(CM)

## 1.33 kB

# sinkApply()

sinkApply(): a convenience function for walking on a RealizationSink derivative for the purpose
of filling it with blocks of data

#### Example: Fill a 1e6 x 1e6 on-disk matrix with random data

```
sink <- HDF5RealizationSink(c(ie6L, ie6L)) # or TileDBRealizationSink
sink_grid <- defaultSinkAutoGrid(sink)

FUN <- function(sink, viewport) {
    block <- array(runif(length(viewport)), dim=dim(viewport))
    write_block(sink, viewport, block)
}

sink <- sinkApply(sink, FUN, grid=sink_grid)

close(sink)
M <- as(sink, "DelayedArray")</pre>
```

## rbind(), cbind(), and sparsity

rbind() and cbind() of DelayedArray objects now propagate sparsity

```
tenx1 <- HDF5Array::TENxMatrix("tenx1.h5")  # is_sparse(tenx1) is TRUE
tenx2 <- HDF5Array::TENxMatrix("tenx2.h5")  # is_sparse(tenx2) is TRUE
bigtenx <- cbind(tenx1, tenx2)
is_sparse(bigtenx)  # TRUE
blockApply(bigtenx, FUN, ...)  # will take advantage of sparsity
```

Recent additions to package HDF5Array

#### Recent additions to package HDF5Array

HDF5Array(): can now take an URL to a file on Amazon S3 (kind of slow!)

H5SparseMatrix: a DelayedMatrix subclass for representing and operating on an HDF5 sparse matrix stored in CSR/CSC/Yale format (e.g. 10x Genomics and h5ad formats)

Recent additions to package HDF5Array

## Work in progress and future work

#### Work in progress:

h5summarize(..., op="sum"): Optimized summarization of an HDF5 dataset or subset:

- Implemented in C (direct calls to HDF5 C lib in Rhdf5lib)
- Operates at the level of the physical chunks
- More efficient than blockApply()
- Integration to DelayedArray/DelayedMatrixStats: h5summarize() will be used behind the scene by things like rowVars()

#### Future work:

SparseArray objects: In-memory sparse representation of arrays of arbitrary dimensions

- Already used internally by block processing of sparse DelayedArray objects (current name is SparseArraySeed)
- Will go to their own package (currently in DelayedArray)
- Implement fast native operations: arithmetic, Math group (e.g. log), summarization, etc..
   This will benefit block processing of sparse DelayedArray objects
